Appendix 3: Applying risk appetite

The September 2021 corporate risk review paid particular attention to our risk

appetite and our anticipated direction of travel for each risk. Risk owners were asked

to consider how effectively risks are being managed down, or out of the register, and

the extent to which controls have been effective or not. Integral to these discussions

was consideration of our risk appetite, and how risks that are inconsistent with our

appetite will be brought back into line.

Example: Ash Die Back (ADB)

Step 1: Consider the risk, its impact and residual risk score

It is important here to select the most severe impact. For example, in the case of

ADB, impacts range from increased liability, public safety, budget to reputational

impacts. Of all these impacts public safety is the most severe impact.

Step 2: Determine the council's risk appetite¹

On the basis that public safety is the most severe impact, we have used our appetite

statement in relation to compliance and regulation.

Risk appetite suggests that because the most severe impact could be public

protection, then will we only accept a cautious risk appetite and therefore, this should

be at most a moderate risk, owing to the serious potential for death or injury.

Step 3: Compare the appetite to the actual risk score

Our risk management guide includes the following table. I have added a final column

to demonstrate how our risk appetite statement maps onto our risk severity (this is

our classification for a risk on the basis of the likelihood and impact being combined).

¹ The council's risk appetite statement can be found here, from page 36.

Risk Score	Risk Severity	Escalation Criteria	Risk appetite
C5, D4, D5,	Minor	Risk easily managed	Minimalist
E4, E5		locally – no need to	Cautious
		involve management	Open
			Hungry
A5, B4, B5,	Moderate	Risk containable at	Cautious
C3, C4, D3,		service level – senior	Open
E2, E3		management and SLT	Hungry
		may need to be kept	
		informed	
A3, A4, B3,	Major	Intervention by SLT	Open
C2, D1, D2,		with Cabinet	Hungry
E1		involvement	
A1, A2, B1,	Critical	Significant SLT and	Hungry
B2, C1		Cabinet intervention	

Our ash die back risk is classified as B2 – Critical Risk: Likely / High impact. Critical risks, as per our risk appetite statement, should apply to only those risks for which we are risk hungry. Yet our appetite in relation to ADB, as confirmed by step 3, is cautious and should therefore be a moderate risk at most.

Step 4: Discuss whether we are comfortable with the risk being inconsistent with our risk appetite

Discussion is key. Sometimes risk owners will decide that they are not comfortable and immediate action needs to be taken to reduce/remove the risk. More often though, owners are satisfied that the controls in place will bring the risk back into line with our risk appetite statement.

ADB is a good example of a risk being beyond our appetite, but where we are comfortable with the inconsistency on the basis of our plans. In the case of ADB, there is a direction of travel with clear plans to get the risk back into our comfort zone.

Step 5: Set out the anticipated direction of travel

This conversation can help to review the effectiveness of controls, and may expose gaps in our management of the risk. Furthermore, this direction of travel will inform the continued review of the risk to ensure progress is being made in the right direction, within anticipated time frames.

Commonly, risk owners expect to see the likelihood of a risk reducing, with the impact staying the same for the foreseeable future. In the case of ADB, our current review anticipates that the residual risk will be further reduced and brought closer to, but perhaps not within, our risk appetite.
